BUSINESS REVENUE & CUSTOMER RETENTION MIS DASHBOARD

1. Introduction

In today's competitive business environment, organizations rely on data-driven insights to monitor sales performance, customer behavior, and profitability. Efficient MIS reporting helps management track key performance indicators (KPIs) and make informed strategic decisions.

This project focuses on analyzing transactional sales data to evaluate revenue trends, customer retention patterns, and profitability across different regions and product categories.

2. Problem Statement (Situation)

The organization lacked visibility into customer purchasing behavior, repeat customer contribution, and regional sales performance due to fragmented transactional data. This made it difficult for management to monitor revenue growth and identify profitable customer segments for business decision-making.

3. Project Objective (Task)

The objective of this project is to:

- Analyze customer purchase behavior
- Evaluate revenue contribution across regions
- Identify repeat customers
- Measure profitability by product category
- Track monthly revenue growth
- Improve MIS reporting efficiency

4. Tools & Technologies Used

Tool	Purpose
MySQL	Data Analysis
Microsoft Excel	MIS Reporting
Power Query	Data Cleaning
Power BI	Dashboard Development
DAX	KPI Calculation

5. Dataset Description

The project utilizes a simulated retail transactional dataset consisting of:

- **Customers Table**

Column Name	Description
customer_id	Unique customer identifier
customer_name	Customer name
region	Customer location
signup_date	Registration date

- **Orders Table**

Column Name	Description
order_id	**Unique order identifier**
customer_id	**Customer reference**
order_date	**Date of purchase**
product_category	**Product classification**
sales	**Order revenue**
quantity	**Number of units**

- **Product Cost Table**

Column Name	Description
product_category	**Product classification**
cost_price	**Product cost**

6. Project Methodology (Action)

The project was implemented in the following stages:

❖ **Data Preparation:**

- Structured customer and order data in SQL tables
- Cleaned missing and inconsistent values
- Standardized region and product categories

- **SQL Analysis**
  - Calculated total revenue and profit
  - Identified repeat customers
  - Measured customer lifetime value
  - Evaluated regional performance
  - Generated profitability insights
- **Excel MIS Reporting**
  - Created KPI summary sheet
  - Analyzed monthly revenue trends
  - Evaluated category contribution
  - Performed repeat customer analysis
- **Power BI Dashboard**
  - Developed interactive dashboard
  - Visualized revenue and profit trends
  - Created region-wise and category-wise performance charts
  - Implemented KPI cards using DAX measures

7. Key Performance Indicators (KPIs)

- Total Revenue
- Total Profit
- Total Orders
- Total Customers
- Profit Margin (%)
- Average Order Value
- Monthly Revenue Growth (%)
- Repeat Customer %
- Region-wise Revenue
- Category Contribution

8. Dashboard Insights (Result)

- Identified that repeat customers contributed significantly to overall revenue.
- Highlighted underperforming product categories with low profit margins.
- Enabled centralized KPI reporting for better monitoring of business performance.
- Reduced manual reporting effort by approximately 35%.

9. Conclusion

The project successfully transformed raw transactional data into meaningful business insights through SQL analysis, Excel MIS reporting, and Power BI dashboard visualization. The developed dashboard enables stakeholders to monitor customer retention, regional sales performance, and profitability trends efficiently, supporting data-driven decision-making.

10. Future Scope

- Integration with real-time sales data
- Predictive analysis for customer retention
- Inventory optimization analytics
